I would recommend buy it used.18 of 24 people found the following review helpful. Hopelessly DisorganizedBy ScomoI had to use this book in two classes for my Land Use/GIS degree. The book's layout is rather confusing, and the information is not laid out in a logical manner. Headings and sub-headings are not apparent and do not follow a natural progression. Seems like the book was put together with a cut-and-paste method! The text is about as dry as a well-done pot roast. Good bedtime reading!The primary purpose of map making is to guide the reader's eye to areas of importance, and to get the information across to the reader in a concise, interesting, and elegant manner. This book does none of these well.The breadth of information, however, is quite good, hence the two stars. This is probably why it is used frequently by faculty.0 of 1 people found the following review helpful. Five StarsBy LEANDRO LUIZAmazing!

This introductory textbook introduces students to the different types of map projections, map design, and map production.Cartography is generally a sophomore or junior level course for geography majors and many professors are beginning to introduce computer cartography throughout the course.. A CD-ROM containing 120-day time-limited version of ArcView GIS, including text specific exercises, is packaged free with every text. .
