Excellent introduction to Piano's worksBy FrednTidyThis book covers virtually every project that Renzo Piano had worked on up until the time of the book's publication. It covers all of his built and unbuilt works, and then more. Did you know that he has designed a car and a ship? Although each project gets only a few pages, the drawings and text are concise and get right to the point. The best part of this book is that the text is in Piano's own words, so that the explanations and commentaries come straight from the source. In his text, he often emphasizes the importance of getting your design built and enjoying the process of building.In addition to talking about each of his projects, he also discusses his own views at the beginning and end of the book on broad topics like the pursuit of architectural design and the architectural profession. This is particularly beneficial for architecture students and young people who want to know more about the field, and it seems like Piano probably had this in mind when he discusses his views.The book is now a bit dated, for example late 1990's projects like the Tjibaou Cultural Center had not yet been completed and are presented here in mostly models, drawings, and early construction photos. However, it is still very useful because it offers a terrific first-person insight into one of the most respected architects of recent decades. I truly hope that they will update this excellent book someday, but for now

I still recommend it to any Renzo Piano fan and anyone who is interested in architecture.

Renzo Piano (Genoa, 1937) studied architecture at the Polytechnic in Milan. Since winning the competition to design the Centre Pompidou in Paris (1971) along with Richard Rogers, Piano has become a prominent figure on the international architectural scene, with more works constructed outside Italy than in his own country. Piano brings a similar approach to both the small and the large scale. He has directed projects of very varying sizes: small buildings like the travelling IBN Pavilion and the Brancusi Museum; and great megastructures like Kansai's International Airport Terminal built on a man-made island in the Bay of Tokyo, and the remodeling of Berlin's Potsdamer Platz where work is scheduled to be completed in 2002.
